## Introduction

Implementing VMware View in an organization introduces a new set of challenges for IT, pushing its infrastructure to the limit and challenging its current administration policies. VMware View requires that an organization meet SLA commitments and provide QoE assurances. The inability to comply with these requirements will result in user frustration and loss of user productivity.

This Solution Guide describes a standardized integration solution in which Radware's load balancing and acceleration product, Alteon, is set up in front of a VMware View environment to ensure its availability and performance in order to meet SLA and QoE requirements.

## Radware Alteon

Radware's Alteon ADC solution provides advanced and comprehensive application delivery capabilities needed to effectively meet the challenges of application deployment and application delivery in today's data centers. Equipped with advanced application acceleration capabilities, a global server load balancing solution and a comprehensive Layer 7 modification tool, Alteon ADC is well-positioned as the leading ADC in the industry. Alteon ADC also spearheads the ADC virtualization trend with ADC-VX™, the industry's first ADC virtualization and consolidation platform based on a specialized ADC hypervisor, and Alteon virtual appliance (Alteon VA).

### Integrated Application Acceleration Capabilities with FastView™

Radware's Alteon ADC delivers a wide set of advanced application acceleration capabilities, designed to accelerate application response time while offloading server processing. By offloading processor intensive operations, such as SSL, Web compression, caching, HTTP multiplexing, and TCP optimization, it frees the servers' CPUs to handle additional requests, which results in reduced application server hardware and lower CAPEX.

Radware's FastView™ result-driven acceleration technology adds Web Performance Optimization (WPO) capabilities on top of the standard ADC application acceleration features to deliver the fastest Web application response time and ensure best application SLA. The result is best business impact for increased revenues, more page views, higher customer loyalty as well as improved employee productivity when using enterprise Web applications for all browsers and all end-user device types – starting from the first page visit.

### Shaped to Deliver Applications

With Radware's AppShape™ technology, Alteon ADC benefits from reduced deployment time of application delivery services by 85%, while guaranteeing maximum value for each business critical application in terms of availability, performance and security. AppShape offers configuration templates and wizards for leading business applications. AppShape allows application delivery services to be

fully managed and operated from an application-centric view, including operational screens, logs and compliance – resulting in simplified and efficient application management in the ADC. Furthermore, AppShape’s reporting capabilities help organizations with capacity planning tasks by providing per application trends analysis and resources utilization reports.

## **VMware Horizon**

VMware View delivers rich, personalized virtual desktops as a managed service from a virtualization platform, built to deliver the entire desktop, including the operating system, applications, and data. With VMware View, desktop administrators virtualize the operating system, applications, and user data and deliver modern desktops to end-users. VMware View provides centralized automated management of these components for increased control and cost savings. It improves business agility while providing a flexible high performance desktop experience for end-users across a variety of network conditions.

VMware View brings the agility and availability of cloud computing to the desktop and applications. Built on VMware vSphere, View delivers desktops from a single integrated platform as part of your cloud services. You can dynamically allocate resources to enable highly responsive and available environment to end-users. You can scale up and down desktop services on demand to quickly meet changing business needs and proactively protect against planned and unplanned downtime. You can run your desktops as business critical services for your workforce.

VMware View increases control of desktops, applications and data by delivering and managing them as centralized services. A single, powerful administrative console provides oversight of desktop services while enabling IT to execute previously cumbersome tasks such as provisioning, updates, and patches, with a few mouse clicks. You can manage desktop components separately for greater flexibility in provisioning, updates, and delivery. You can easily apply policies and quickly enable and disable users, all from a centralized console for optimal business response. View frees up time from maintenance for technology innovation.

# Radware Alteon and VMware Horizon Server Architecture

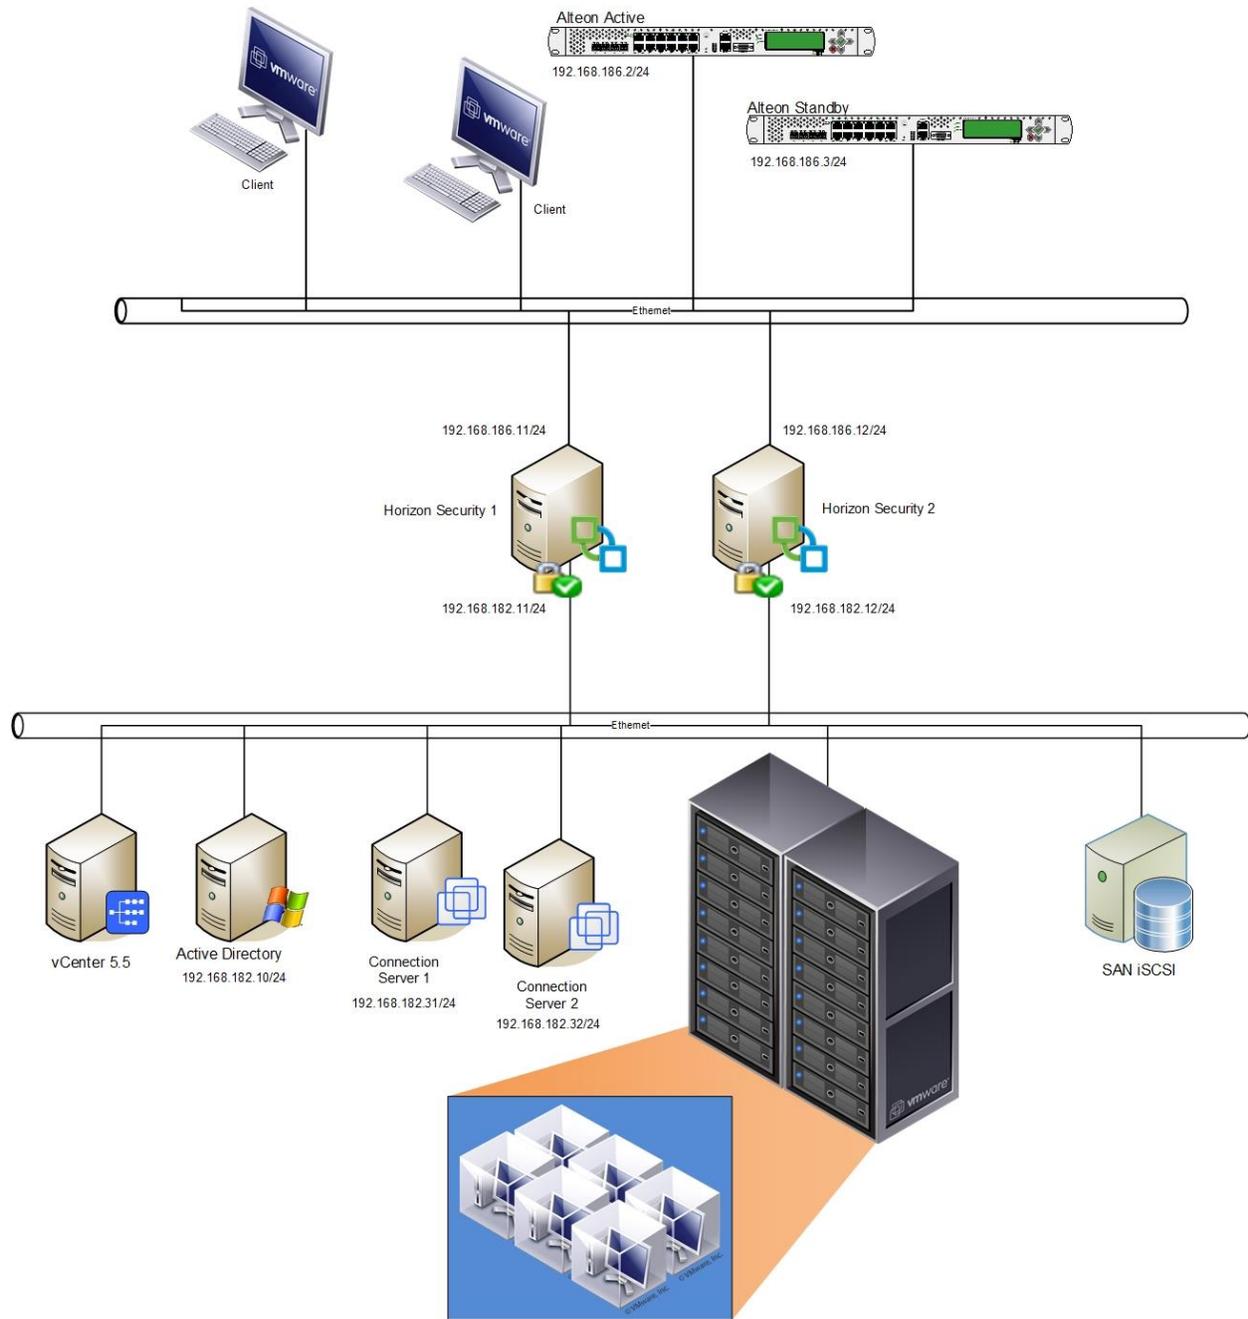

FIGURE 1 – TESTED EXAMPLE CONFIGURATION

## Prerequisites

### Important Implementation Notes

1. Throughout this guide, reference is made to the "Radware" pre-configured certificate, but you can import a certificate or create a new certificate in Alteon. For more information on exporting, importing, or creating a certificate, see the *Alteon Application Switch Operating System Application Guide*.
2. A VMware Horizon SSL Certificate must be installed on all connection servers and on the Alteons.
  - The certificate must include inside the server's certificate (DNS field), connection servers names, and VIP name. For example:  
VIP - view.vradware.com and connection servers con1.vradware.com, con2.vradware.com, con1 and con2. If you have Wildcard certificate use \*.vradware.com
  - A common name should be the VIP name. For example: view.vradware.com
3. VMware Horizon can work using the following different methods:
  - **Blast Secure Gateway** - This means that all traffic (PCoIP and login) on port 443 (secure) go through the connection servers (proxy mode).
  - **PCoIP Secure Gateway mode** - All PCoIP traffic goes on port 4172 through the connection servers (proxy mode).
  - If you select only **use Secure Tunnel Connection**, logins go through the connection servers (443 secure) and PCoIP traffic goes directly from the client to the selected VM.
4. **VERY IMPORTANT** - If you are using **PCoIP Secure Gateway mode** - change all load balancing on ports 4172,443 and 8443 to use source IP persistency (the Layer 7 configuration does not work).
5. Persistency is performed using Layer 4.
6. The Default Aging time for a session is 600 minutes. This can be changed inside the connection servers and inside the Alteon AppShapes script.

### Software and Hardware

The following is a list of the hardware and software tested to verify the interoperability of the presented solution:

- Microsoft Windows 2008 R2 x64bits
- Radware Alteon version 30.0.2
- VMware Horizon Connection, Agent, Composer, Security and client v.6.2
- VMware vCenter 5.5

## **Configuration**

### **Alteon Active Configuration**

#### ***Network Configuration***

```
/c/port 1
    pvid 101
/c/l2/vlan 1
    learn ena
    def 0
/c/l2/vlan 101
    ena
    name "Client.net"
    learn ena
    def 1
/c/l2/stg 1/clear
/c/l2/stg 1/add 1 2 101

## VMware View Connection Servers

### Configure VMware View Connection global settings

1. Go to the **View Configuration > Servers > Connection servers** tab.
2. Edit each connection server, and add the External URL name **https://view.mycomapny.com:443** (this is the name that the clients point to).

The screenshot shows the 'Edit Connection Server Settings' dialog box with the following content:

**Edit Connection Server Settings**

General | Authentication | Backup

**Tags**  
Tags can be used to restrict which desktop pools can be accessed through this Connection Server.  
Tags:  Separate tags with ; or ,

**HTTP(S) Secure Tunnel**  
 Use Secure Tunnel connection to machine [?](#)  
External URL:  Example: https://myserver.com:443 [?](#)

**PCoIP Secure Gateway**  
 Use PCoIP Secure Gateway for PCoIP connections to machine  
PCoIP External URL:  Example: 10.0.0.1:4172 [?](#)

**Blast Secure Gateway**  
 Use Blast Secure Gateway for HTML access to machine [?](#)  
Blast External URL:  Example: https://myserver.com:8443 [?](#)

OK Cancel

## VMware View Security Servers

### Configure VMware View Connection global settings

1. Go to the **View Configuration > Servers > Security Servers** tab.
2. Edit each connection server, and add the External URL name **https://view.mycomapny.com:443** (this is the name that the clients point to).

The screenshot shows a dialog box titled "Edit Security Server - SECURE1". It contains several input fields and sections:

- Server name:** A text box containing "SECURE1".
- HTTP(S) Secure Tunnel:** A section with an "External URL:" label and a text box containing "https://view.vradware.com:443". Below it is an "Example: https://myserver.com:443" with a help icon.
- PCoIP Secure Gateway:** A section with a "PCoIP External URL:" label and a text box containing "192.168.186.200:4172". Below it is an "Example: 10.0.0.1:4172" with a help icon.
- Blast Secure Gateway:** A section with a "Blast External URL:" label and a text box containing "https://view.vradware.com:8443". Below it is an "Example: https://myserver.com:8443" with a help icon.

At the bottom right of the dialog box are "OK" and "Cancel" buttons.

## Technical Support

Radware offers technical support for all of its products through the Radware Certainty Support Program. Please refer to your Certainty Support contract, or the Radware *Certainty Support Guide* available at:  
<http://www.radware.com/content/support/supportprogram/default.asp>.
